## **BEST AVAILABLE IMAGES**

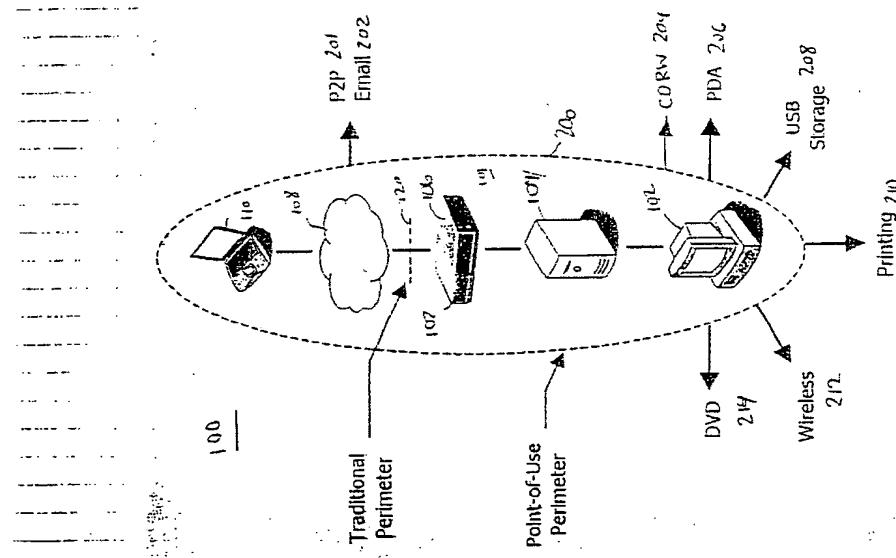

Defective images within this document are accurate representations of the original documents submitted by the applicant.

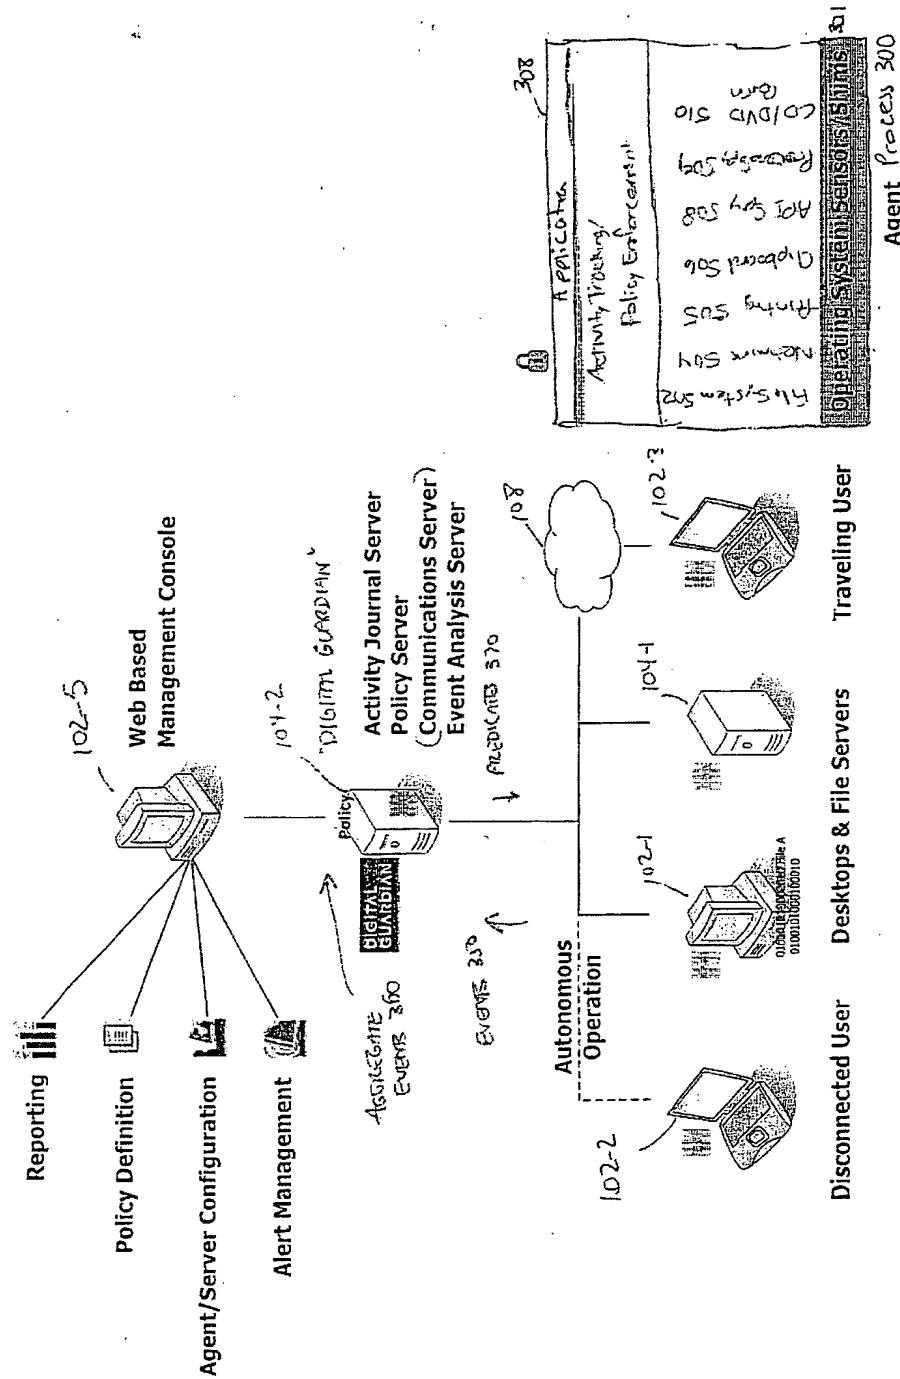

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

**IMAGES ARE BEST AVAILABLE COPY.**

**As rescanning documents *will not* correct images,  
please do not report the images to the  
Image Problem Mailbox.**

43	High	Network	FileOutThroughTunnel	AggregateEvent			

FIG. 4

*Aggregate Event Definitions*

Event Name	Constituent Event Types	Pattern	Scope
FileEdited	FileRead, FileWrite, FileReadWrite	Same processId and fileHandle. beforeHash of first read & afterHash of last write differ. Both reads and writes to same fileHandle. Sum of writes > 0.	Thread
FileCopied	FileRead, FileWrite, FileReadWrite, FileCopy	Command shell: Alternating reads & writes. The reads all have one fileHandle, the writes all have a second one.  Explorer: A long series of reads from one fileHandle followed by a long series of writes to a second. Mind the time period between.  In both cases, the target device must not be removable.	Thread
FileSaveAs	FileRead, FileWrite, FileReadWrite	An app reads one or more files then writes a file	Process
FileLeftThroughRemovableMedia	FileRead, FileWrite, FileReadWrite, FileCopy	Same as FileCopied or FileSaveAs, but target device is removable.	Process
ClipboardToFile	ClipboardCutCopy, ClipboardPaste	Pair a ClipboardCutCopy with all subsequent ClipboardPaste events for that user login until the next copy or the user logs out.  Problem: If the user closes the application that performed the copy and the object was large and the user opts not to keep it there, what happens?	Login
PrintFile	Print, possibly others	Unclear. If there are temp files, intermediate PDF files, etc, then we may perform a chain of custody analysis to figure out just what was printed.	Thread
BurnMaster	FileRead, FileWrite	An app known to burn files reads one or more files then writes a file.	Process
BurnFile	CDWrite, FileRead	Application is recognized as a CD writing app. (Optional)  Series of FileReads from one fileHandle, followed by a series of CDWrite events with the same process. May need to compare filenames, otherwise one read will exhaust all the writes. Alternately, all read files are lumped together with one large burn event. Or perhaps the first read of a new file after the last read from the previous file is the start of the next burn event.	Process
FileLeftThroughNetworkPort	FileRead, TCPIPInbound, TCPIPOutbound, UDPInbound, UDPOutbound, IPSECInbound, IPSECOutbound	An overlapping stream of FileReads interspersed with inbound and outbound network events.  All the network events should be for the same port (?) and to a destination NOT on localhost.  All the network events should be for the same protocol.	Thread

Fig. 5A

*Aggregate Event Definitions*

Event Name	Constituent Event Types	Pattern	Scope
EmailFile	FileRead, TCP/IPInbound, TCPIPOutbound, (other protocols???)	Similar to FileLeftThroughNetworkPort. Combines all interleaving FileReads with the network events.  The application image name is one of those known to be an email program.  May place constraints on the ports, since many emailers use certain well defined ports for SMTP, POP etc.	Process
InstantMessenger	FileRead, TCP/IPInbound, TCPIPOutbound, (other protocols???)	Similar to FileLeftThroughNetworkPort. Combines all interleaving FileReads with the network events.  The application image name is one of those known to be used for Instant Messenger.  May place constraints on the ports.	Process
P2PApp	FileRead, TCP/IPInbound, TCPIPOutbound, UDPIPbound, UDPOutbound, IPSECInbound, IPSECOubound	Constrain the application name to be one of those known to be a P2PApp.  Multiple ports will be used; some or all of them may have constraints. May constrain the protocol per app or per instance.  Similar to FileLeftThroughNetworkPort as concerns interleaved file reads.	Process
FTPFile	FileRead, FileWrite, ???(TCP/IPInbound, TCPIPOutbound)	May want to split into two events, one for reading and one for writing.  Constrain to the common FTP port, unless the app is known by name to be an FTP client.  Like FileLeftThroughNetworkPort, look for interleaved reads and network events, or interleaved writes and network events.	Process
RemoteAccess	TCP/IPInbound, TCPIPOutbound, UDPIPbound, UDPOutbound, IPSECInbound, IPSECOubound	Do not incorporate FileRead events.  Several ports may be used.  Look for known image names of remote accs.	Process
TunnelOut	TCP/IPInbound, TCPIPOutbound, UDPIPbound, UDPOutbound, IPSECInbound, IPSECOubound	All events use same protocol. Only two processes used. Two different apps and four ports are used. One of the ports is remote. Event 1: The first app sends outbound from local port 1 to local port 2. Event 2: The second app (the tunneler) receives inbound from local port 1 to local port 2. Event 3: The tunneler also sends from local port 3 to remote port 4. Both events of the tunneler share the same thread (probably).	Login
TunnelIn	TCP/IPInbound, TCPIPOutbound, UDPIPbound, UDPOutbound, IPSECInbound, IPSECOubound	All events use same protocol. Only two processes used. Two different apps and four ports are used. One of the ports is remote. Event 1: The first app (the tunneler) receives inbound from remote port 1 to local port 2. Event 2: The tunneler sends outbound from local port 2 to local port 3. Event 3: The second app also receives inbound from local port 3 to local port 4. Both events of the tunneler share the same thread (probably).	Login
TunnelInOut	TCP/IPInbound, TCPIPOutbound, UDPIPbound, UDPOutbound, IPSECInbound, IPSECOubound	Multiple protocols may be used. More research needed. More than three ports are used.	Login

Docket/App No.: 3602.1002-000  
Title: Adaptive Transparent Encryption  
Inventors: Nicholas Stamos, *et al.*

*Aggregate Event Definition*

Event Name	Constituent Event Types	Pattern	Scope
FileLeftThroughTunnel	FileRead, TunnelOut	Similar to FileLeftThroughNetworkPort, Combines all interleaving FileReads involving a process that is participating in a TunnelOut event.  If more than one file is read, the source destination will be a count of the files read.	Login?

A screenshot of a Hotmail inbox. The top navigation bar includes 'Hotmail', 'Today', 'Mail', and 'Calendar'. Below the bar, there's a search field and a link to 'Compose a new message'. The inbox lists one new message from 'Get Extra Storage' with the subject 'Get Extra Storage'. The message body contains a URL: 'http://www.getextrastorage.com'. The bottom of the screen shows a toolbar with icons for 'Compose', 'New Message', 'New Contact', and 'Hotmail Help'.
